

Profoto Softbox User Guide

Profoto Softbox

User Guide

Congratulations on acquiring a Profoto Softbox!

This guide has been made to provide you with all the essential information you need to quickly familiarize yourself with your new softbox and start light shaping in no time.

This guide will provide valuable insights and practical advice applicable to your specific Profoto Softbox, no matter what shape or size you opted for.

**Get started with your new
Profoto Softbox**

The Profoto Softbox is quick and easy to assemble. Unfold the softbox by retracting the ring upwards until it clicks. Use the protuded part of the plate as support.

Always unfold your Profoto Softbox separately and then attach it to your flash.

When in position, use the clasp to secure the softbox onto the flash.

The Profoto Softbox is just as easy to disassemble when you are done. Quickly fold it by pressing the unlock section. Always disassemble your Profoto Softbox when removed from the flash.

Once unfolded, attach the inner diffuser by hanging the snap hooks on the diffuser onto the fabric loops located inside the softbox.

Attach the outer diffuser to the Velcro area on the edge of the softbox. The white line indicates the correct diffuser position. If preferred, you can leave both the inner and outer diffusers attached when disassembling the softbox.

The Profoto Softbox is compatible with both flatfront and protruded head light sources. It is heat resistant up to 500W, making it suitable for use with both lights using LED and halogen as modelling light.

Note: Max 500W halogen, 8 flashes (2400Ws)/min.

When you are done using the softbox, secure it by using the attached strap to keep it compact, and then carefully place it back into its designated case.
